

Student 4 - Live Demo, Testing & Conclusion

Slides 8–9 | Time: 2 min 30 sec | Role: Prove it works, wrap up strong

"Enough slides. Let me show you the real thing."

Click to Slide 07 — Live Demonstration. Then immediately switch to the terminal window.
Confident opening — "enough slides" signals action.

"I will compile and run the program right now."

In terminal, type: `javac -d bin src/*.java` — Press Enter. Show compilation completes with no errors.

"Compilation successful. Now let us run it."

Type: `java -cp bin Main` — Press Enter. The menu appears.

"This is the main menu. Notice the live counters at the bottom — Lost, Found, Resolved. These update in real time."

Point at the terminal output showing the menu and counters.

"Let me post a lost item. I choose option 1."

Type 1 — Press Enter.

"I will enter — Phone as the name, Electronics as category, today's date, Library as the location, and a contact number."

Type each field one by one. Pause briefly after each Enter so audience can see.

"Saved. The system assigned it ID 16. Let us verify."

Point at the confirmation message showing "Saved. ID: 16."

"Option 3 — View Lost Items."

Type 3 — Press Enter. The table appears.

"There it is. ID 16, Phone, Electronics, Library, today's date, status OPEN. The counter now shows Lost: 2."

Point at the new row in the table. Then point at the updated counter.

"Now let me search for it. Option 5 — Keyword search — type Phone."

Type 5, then 1, then Phone — Press Enter after each.

"One result found. The stream filtered all items and returned only the match."

Point at the search result in the terminal.

"Now the best part — claiming the item. Option 6."

Type 6 — Press Enter.

"Enter the item ID — 16. The system shows the item details and asks for confirmation."

| Type 16 — Press Enter. Point at the item display.

"Mark resolved? Y."

| Type y — Press Enter. "Done." appears.

"Done. The status changed from OPEN to RESOLVED. The file was rewritten."

| Point at the "Done." message. Pause 1 second.

"Let me verify. View Resolved — option 7."

| Type 7 — Press Enter.

"There it is. ID 16, Phone, status RESOLVED. The full cycle — Post, Save, Search, Claim — complete."

| Point at the resolved item in the table. Make a circular motion to indicate "full cycle."

"Now let me show you the test results."

| Exit the app (type 8, then y). Type: java -cp bin Tests — Press Enter.

"23 tests. All passed. Zero failures."

| Point at the final line showing "23 passed, 0 failed." Let it sit for 2 seconds.

Pause here — this is a strong moment. Let it sink in.

"Let me now wrap up with what we learned."

| Click to Slide 08 — Conclusion.

"Six things. First — Separation of concerns. Model, service, storage, UI. Each class has one role."

| Point at Card 1.

"Second — Input validation. We reject bad data before it ever touches storage."

| Point at Card 2.

"Third — Streams and lambdas. Made our filter and search logic concise and readable."

| Point at Card 3.

"Fourth — Git collaboration. Branches, commits, and pull requests on one codebase."

| Point at Card 4.

"Fifth — File I/O with care. Files are always closed safely using try-with-resources."

| Point at Card 5.

"And sixth — Testing early. A test harness catches regressions before the demo."

| Point at Card 6. Emphasize "before the demo" with a nod.

"That is LAFSys. 403 lines of Java. No external libraries. A real solution to a real problem."

| Stand straight. Make eye contact with the audience.

"Thank you. We are happy to take any questions."

| Step back slightly. Smile. Open posture — hands not crossed.

End with confidence. Wait for questions.
